

External damper data never beat the native baseline — the native recipe did

Every external-data route (2,175 pHash-vetted community images) at every dose · failure mode = recall drop from label-style / domain mismatch

external labels ARE learnable — the transfer is what fails

Also negative: pretrain-then-finetune (no run beat baseline) and in-domain source pretraining (−7.5 mAP@0.5, genuine negative transfer).
